Oceans and tides
An ocean is a huge body of salt water. Oceans are always moving. The water level on the shore rises and falls. This is called the tide. As the tide goes in and out, it can bring sand and rocks with it. Tides move material slowly. Over time though, rocks and sand can travel a long distance.
When the tide goes out, a little water gets trapped in holes between the rocks. These are called tide pools.
12
How Do Wind and Water Change Earth?
Wave power
Wind blowing over the surface of the water creates waves. Ocean waves pound rocks on the shore. The pounding slowly breaks them down into tiny grains of sand. The sand builds up to form beaches.
What do you think?
Is it possible for sand dunes to be found at the beach? Why or why not?
How Do Wind and Water Change Earth?
Protecting Earth's Surface
Earthquakes, Eruptions, and Other Events that Change Earth
